

A Deep Learning model for Predicting Traffic Conditions using GPS Bus Data

Smart TrafficHub / Älypysäkki

Rodrigo Borges

Supervisor: Kostas Stefanidis

February 11, 2021

Tampere University

Overview

- Predicting traffic conditions based on GPS Bus Data
- Predicting availability of bus lines based on historical information of occupation
- Predict individual boarding and alighting locations based on smart card data

Overview

- Predicting traffic conditions based on GPS Bus Data
- Predicting availability of bus lines based on historical information of occupation
- Predict individual boarding and alighting locations based on smart card data

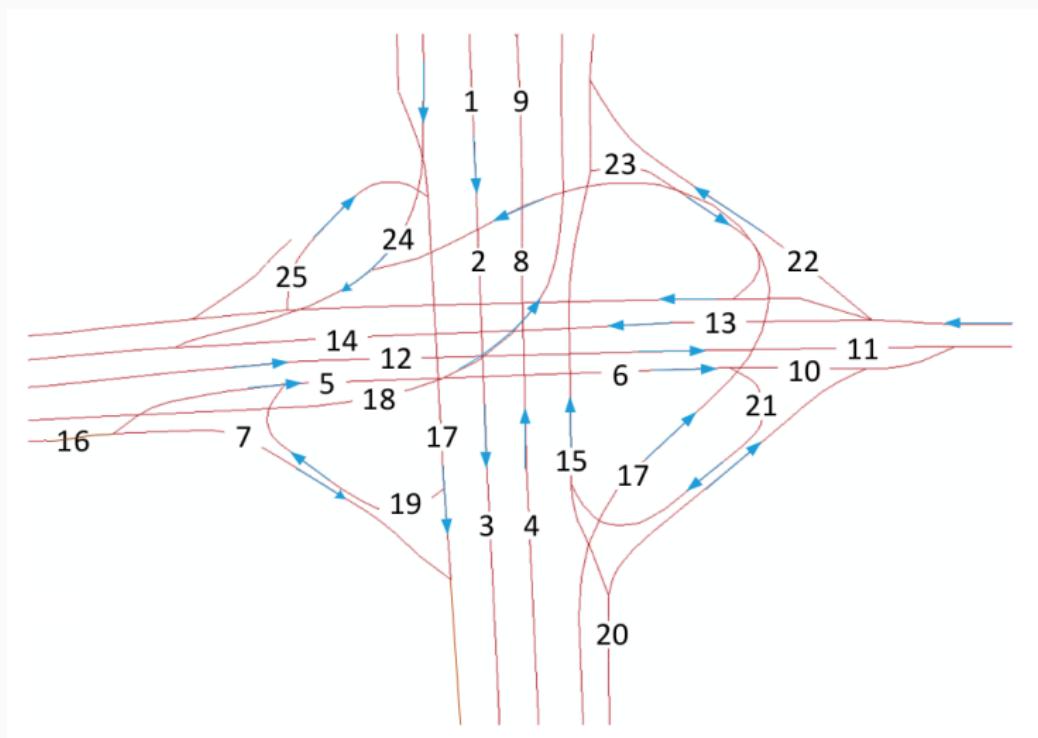

Table of contents

1. Goal
2. Data Preparation
3. Model
4. Future Works

Goal

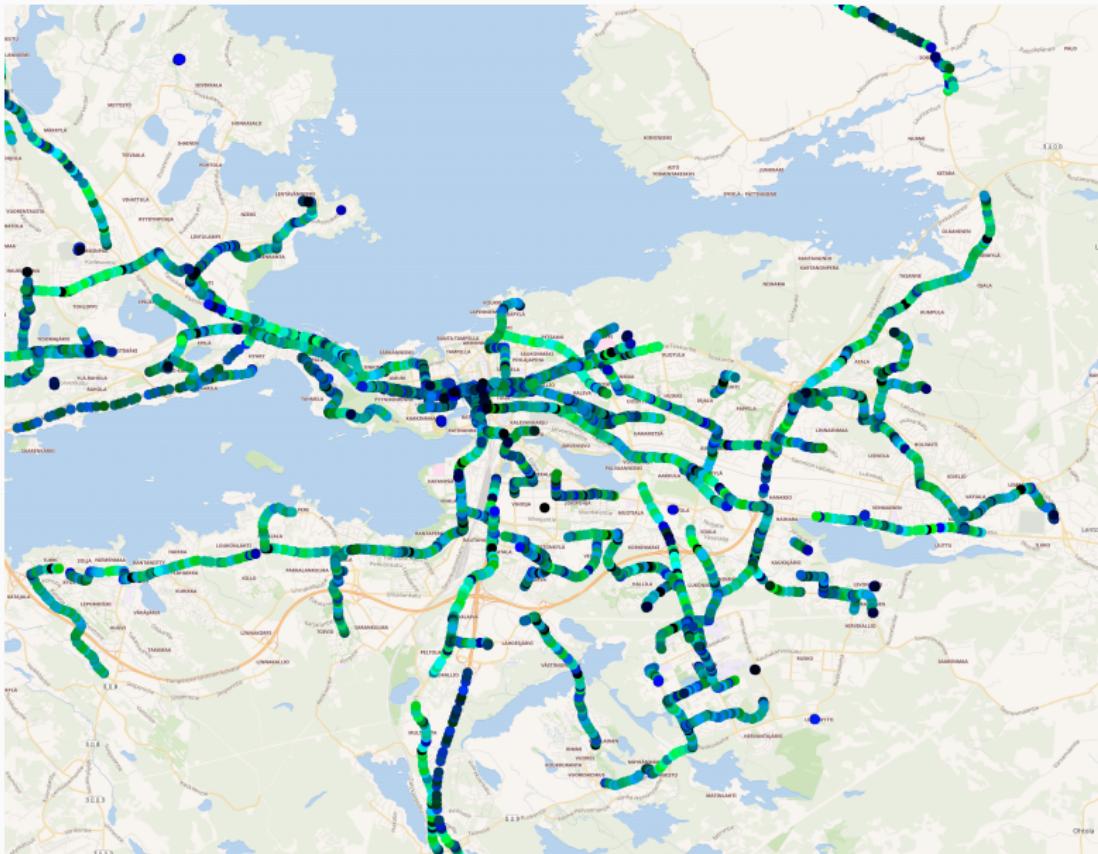

Goals

- Spatiotemporal dependency, capturing distant and causal effects

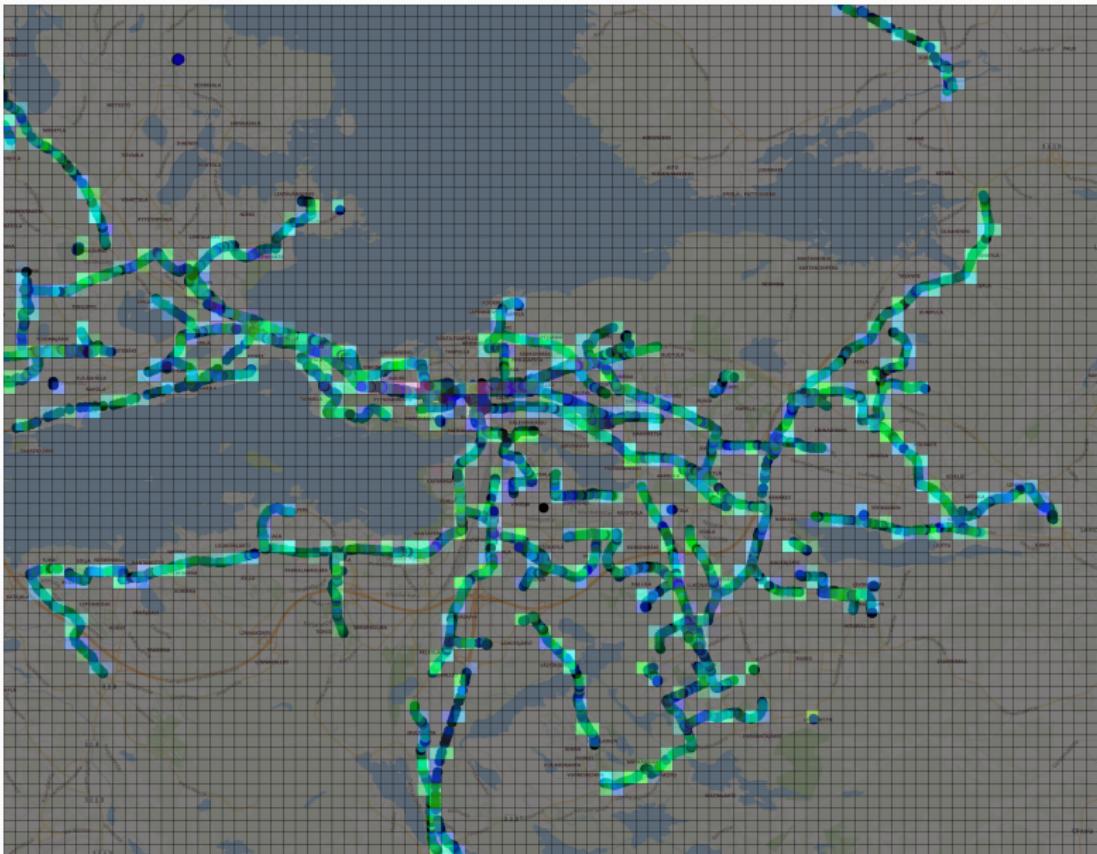

Data Preparation

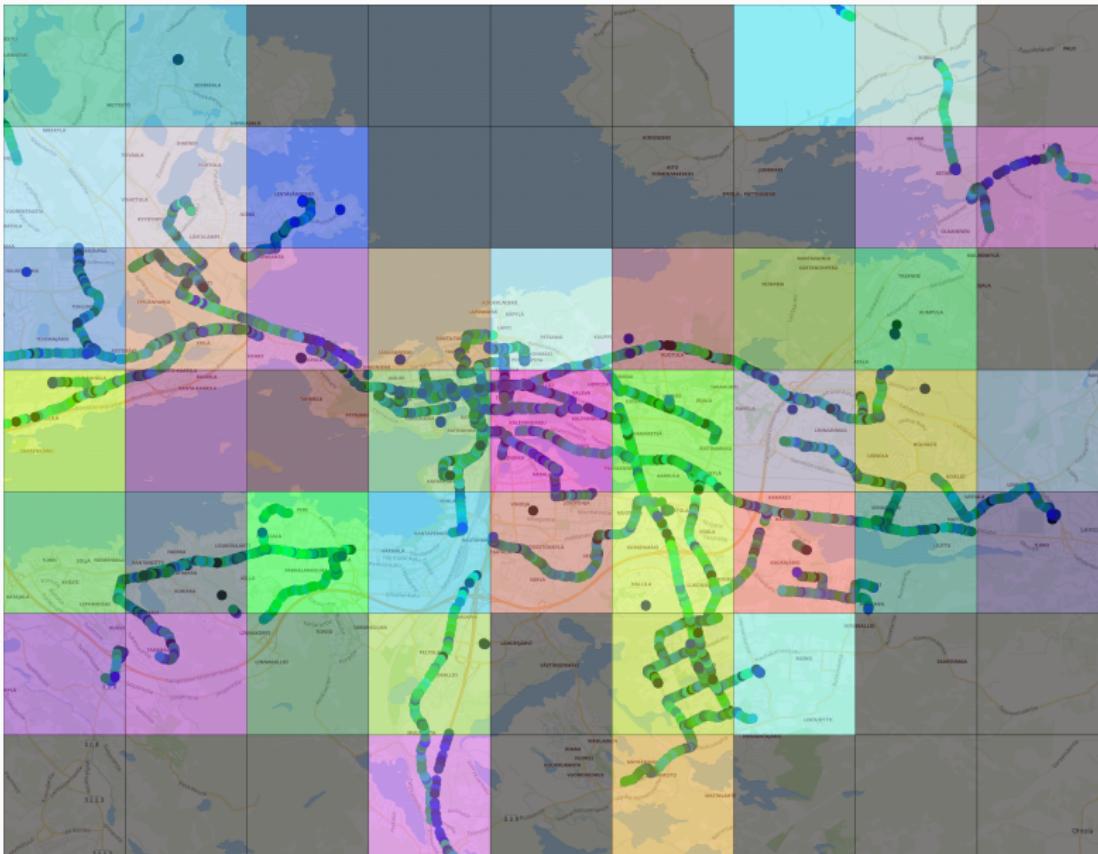

GPS Data - 5 minutes interval

GPS Data - 5 minutes interval (input)

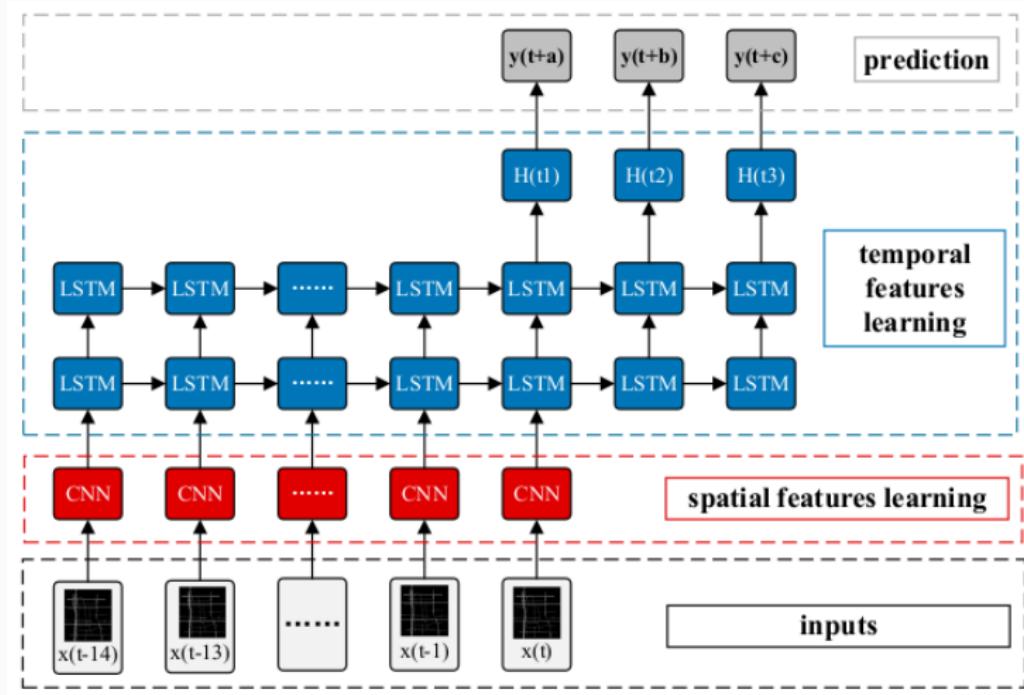

GPS Data - 5 minutes interval (prediction)

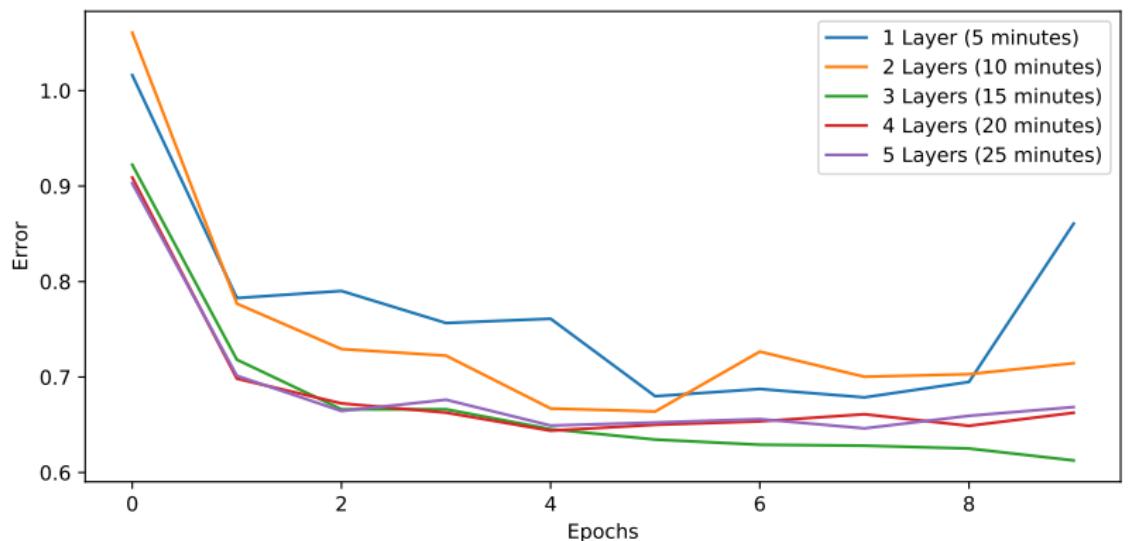

Model

GPS Data

(Yu, H. et al. "Spatiotemporal Recurrent Convolutional Networks for Traffic Prediction in Transportation Networks." Sensors 17 (2017))

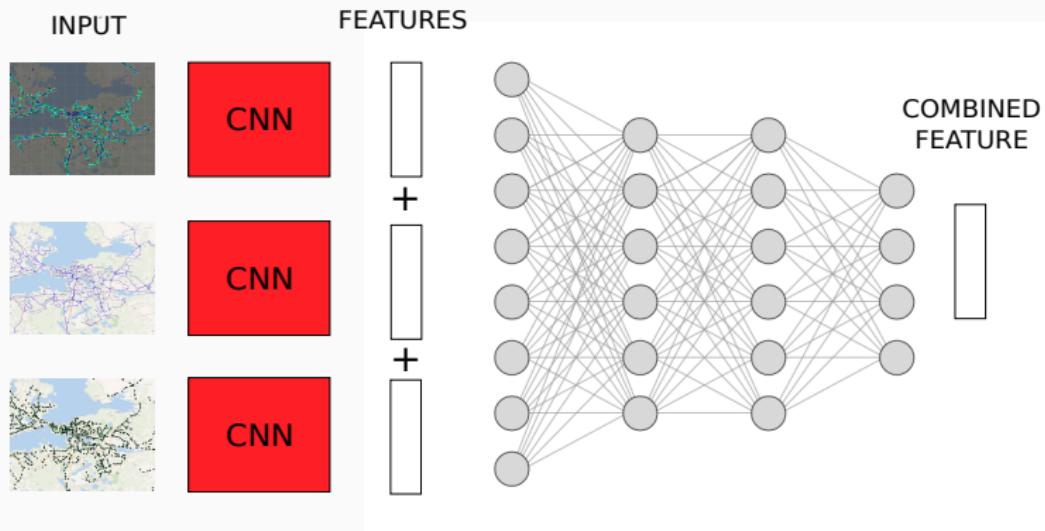

First Results

Future Works

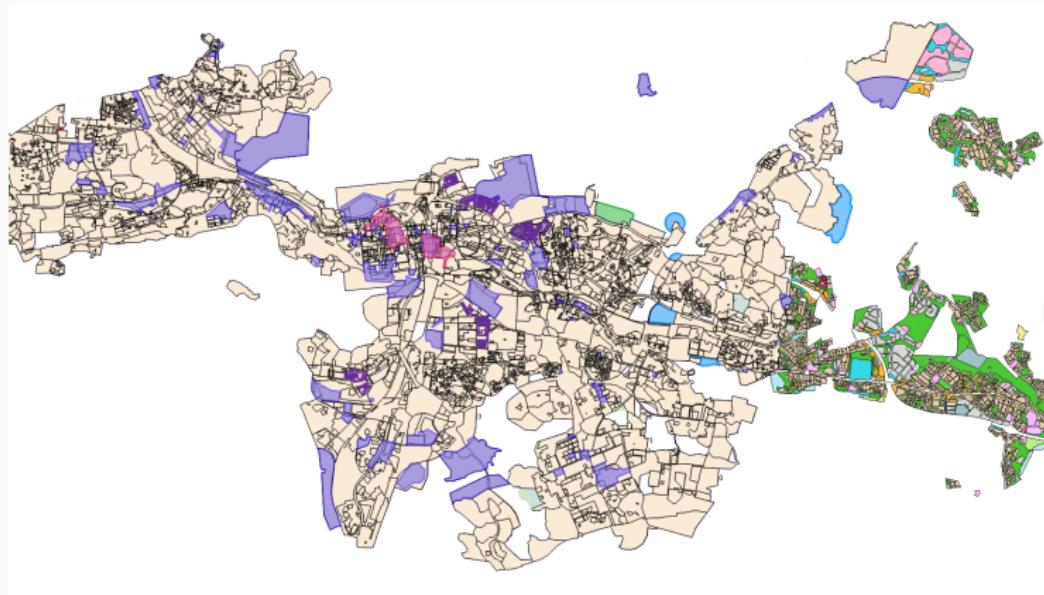

Data integration

- Combine long and short term memory
- Combine dynamic inputs like weather, humidity, sensors...

Prediction Shapes

- Complex shapes instead of regular grids
